Understanding the Setup

Your lecturer will provide you with the following connection details for your class:

- **Host Name**
- **Username**
- **Password**
- **Port Number (3306)**

Do **not** use another class's username or password.

Each class has been assigned its own MySQL account.

You should only use the account assigned to **your own class**.

Database Naming Convention

All databases that you create **must start with your assigned database prefix**.

For example, students from **C237-016-E65R** may create databases such as:

- c237_016_team1_supermarketApp
- c237_016_team2_studentListApp
- c237_016_team3_project

Do **not** create databases such as:

- team1_supermarketApp
- team2
- c237_070_team3

These databases do not follow the required naming convention and may fail to be created.

Responsible Use

Although students within the same class share the same MySQL account, **each project team is responsible for its own database.**

Please observe the following:

- Only access the database created by your own team.
- Do not modify, delete or interfere with another team's database.
- Do not intentionally view or copy another team's work.
- Do not share your class username or password with students from other classes.

Any unauthorised access or modification of another team's database may be treated as academic misconduct.

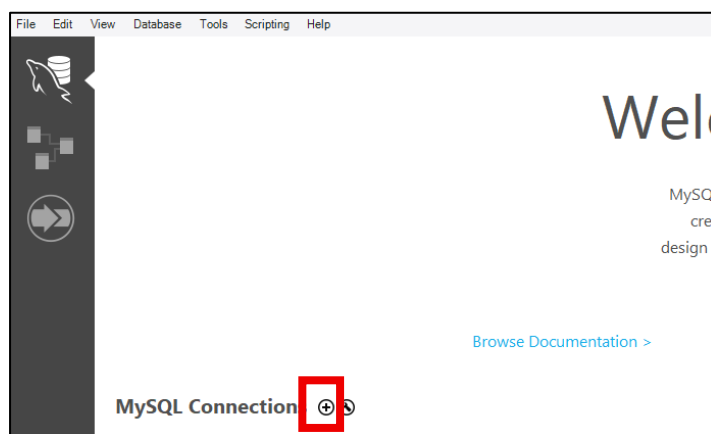

Steps to connect to Azure MySQL using MySQL Workbench

Follow the steps below if you are connecting using the student account.

Step 1: Open MySQL Workbench

Open **MySQL Workbench**.

Click the **+** icon beside **MySQL Connections**.

Step 2: Enter the connection details

Enter the details provided by your lecturer.

Field	What to enter
Connection Name	C237 Database
Connection Method	Standard (TCP/IP)
Hostname	(Provided by your lecturer)
Port	3306
Username	(Provided by your lecturer)
Password	Click Store in Vault... and enter the password provided by your lecturer

Note: Your username and password will be provided by your lecturer.

C237 Software Application Development

Step 3: Test the connection

Click **Test Connection**.

If successful, click **OK**.

Then double-click the connection to open it.

Step 4: Create a database

Each project team should create **one shared database** that will be used by all team members throughout this lesson and subsequent lessons.

The database name **must start with your assigned database prefix** (refer to the **Database Naming Convention** section above).

For example, team1 students from **C237-016-E65R** may create a database named:

- c237_016_team1regapp

Note: Replace **team1** with your actual team number (e.g. team2, team5, team8).

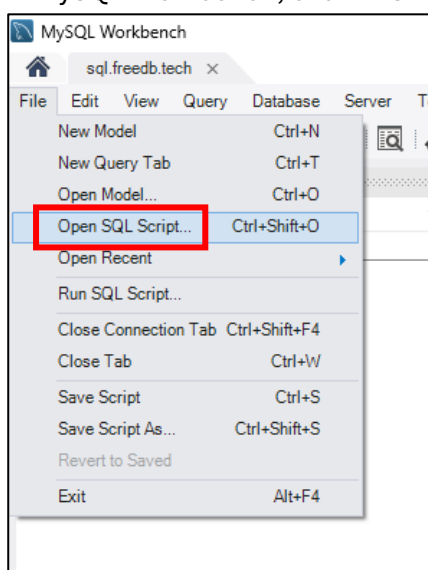

Important:

- Each team should create **only one shared database**.
- All team members should connect to and work on the **same database** throughout the project.
- Do **not** create separate databases for individual team members.

Step 5: Importing the Database Structure

After creating the database:

1. Double-click your database under the **SCHEMAS** panel in MySQL Workbench until it appears in **bold**, indicating that it is the default database.
2. Open the **C237_usersdb.sql** file provided in the **L20 Activity** folder.
 - In MySQL Workbench, click **File → Open SQL Script...**

C237 Software Application Development

3. **Execute the SQL script** by clicking the **lightning bolt**  (**Execute**) button
4. Verify that the **users** table has been created successfully by refreshing the **SCHEMAS** panel if necessary.

Once the database has been imported successfully, continue developing your application by following the same steps taught previously in class.

Troubleshooting

1. I cannot connect.

Check that:

- You are connected to the Internet.
- You entered the correct Hostname.
- You entered the correct Username.
- You entered the correct Password.
- The Port Number is **3306**.

2. I cannot create a database.

Ensure your database name starts with your assigned database prefix.

Example:

Correct:

- c237_016_team1

Incorrect:

- c237_060_team1
- team1
